WEB DEVELOPMENT CASE STUDIES

Three practical website concepts, their purpose, key features, and illustrative interface designs

Included case studies

- Case Study 8: Online Food Ordering Website
- Case Study 26: College Fest Management Website
- Case Study 16: Travel Agency Website

This document presents a concise overview of each website idea, including its objectives, users, core features, technologies, and benefits. The images are illustrative mock-ups created for this report, not screenshots of a live website.

Case Study 8: Online Food Ordering Website

Overview

An online food ordering website allows customers to explore restaurant menus, select dishes, place orders, and arrange delivery or pickup through a convenient digital interface. It connects customers with restaurants and helps make ordering faster and more organized.

Objectives

- Provide a simple way to browse restaurants, food categories, menus, prices, and item descriptions.
- Let users add items to a cart, review their order, enter delivery details, and submit an order.
- Show order confirmation and, in a complete system, status updates such as preparing, dispatched, and delivered.

Key features

- Search and filters for cuisine, price, vegetarian options, and popular dishes.
- Food cards with images, descriptions, prices, ratings, and add-to-cart buttons.
- Cart summary, customer contact details, delivery address, and payment-method selection.
- Restaurant/admin panel to update menus, prices, availability, and order status.

Technology used

HTML structures the pages, CSS styles responsive layouts and food cards, and JavaScript handles search, cart updates, form validation, and interactive controls. A real service would also need a backend, database, secure payment integration, and order-management system.

Benefits and considerations

Customers can order at any time, compare menu options, and save time. Restaurants can manage incoming orders more clearly and reach more customers. Important considerations include accurate menus, privacy of customer details, reliable delivery, and secure payments.

Case Study 26: College Fest Management Website

Overview

A college fest management website is a central platform for promoting campus festivals and coordinating activities. It gives students and visitors a place to view event information, register for competitions, check schedules, and receive updates from organizers.

Objectives

- Publish the fest theme, dates, venue, rules, event descriptions, and organizer contact details.
- Make event registration easy for students, teams, and external participants where permitted.
- Help organizers coordinate schedules, participant lists, announcements, and event results.

Key features

- Homepage banner with fest name, date, venue, and registration call to action.
- Event categories such as cultural performances, technical contests, workshops, and sports.
- Registration forms with participant/team details and confirmation messages.
- Schedule page, FAQs, announcements, sponsor section, gallery, and results/leaderboards.

Technology used

HTML provides the page structure, CSS creates the visual theme and responsive event cards, and JavaScript can validate forms, filter events, and display schedules. A production website may use a backend and database for registrations, authentication, notifications, and event administration.

Benefits and considerations

Participants can find information in one place, while organizers reduce paperwork and duplicate registrations. Clear schedules and announcements improve coordination. The system should protect participant data and provide accessible, mobile-friendly pages.

Case Study 16: Travel Agency Website

Overview

A travel agency website helps customers discover destinations, compare holiday packages, explore itineraries, and send booking enquiries. It acts as an online showcase for travel services and supports customers while planning a trip.

Objectives

- Present destinations, tour packages, prices or starting prices, trip duration, and inclusions.
- Help visitors find packages that match their dates, interests, group size, and budget.
- Collect booking enquiries and provide clear contact details for follow-up by the agency.

Key features

- Destination search and filters for budget, duration, travel style, and season.
- Package cards with destination photos, itinerary highlights, inclusions, exclusions, and price.
- Enquiry or booking form for name, contact information, travel dates, and number of travellers.
- Customer reviews, travel tips, FAQs, cancellation information, and contact/support details.

Technology used

HTML defines destination and package content, CSS builds responsive galleries and package cards, and JavaScript can support search, filters, date checks, and form validation. A full booking platform may require a backend, database, secure payment processing, and integrations with suppliers.

Benefits and considerations

Travellers can compare options conveniently and contact the agency with better information. The agency can showcase its services beyond office hours and organize enquiries. Accurate pricing, transparent terms, secure customer data, and up-to-date availability are essential.
